## On Rings, Polynomials, and Fields

### 1 Section 16.1 - Rings

1. A ring  $R$  is a set that is closed under two binary operations,  $+$  and  $\times$ . The following conditions must also be satisfied:
  - (a) Additive commutativity.
  - (b) Additive associativity.
  - (c) Additive identity.
  - (d) Additive inverse.
  - (e) Multiplicative associativity.
  - (f) Multiplicative distributivity 1 & 2.
2. A ring with unity (or with identity) is a ring  $R$  that has multiplicative identity.
3. A commutative ring is a ring  $R$  that has multiplicative commutativity.
4. An integral domain is a commutative ring  $R$  with identity such that for all  $a, b \in R$   $ab = 0$  implies  $a = 0$  or  $b = 0$ .
5. A division ring is a ring  $R$  that has multiplicative inverse for all nonzero  $a \in R$ .
6. A zero divisor of a commutative ring  $R$  is an  $a \in R$  ( $a \neq 0$ ) such that there exists a nonzero  $b \in R$  such that  $ab = 0$ .
7. The ring of quaternions is the set  $\mathbb{H} = \{a + b\hat{i} + c\hat{j} + d\hat{k} \mid a, b, c, d \in \mathbb{R}\}$ , where  $1 = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$ ,  $\hat{i} = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix}$ ,  $\hat{j} = \begin{pmatrix} 0 & i \\ i & 0 \end{pmatrix}$ ,  $\hat{k} = \begin{pmatrix} i & 0 \\ 0 & -i \end{pmatrix}$ .
